

CYCAS REVOLUTA

www.limakhotels.com

Cycas revoluta, commonly known as Sago Palm or Japanese Fan Palm, has a palm-like appearance but actually belongs to the Cycadaceae family and is an extremely ancient plant species that has existed since the age of dinosaurs. With its stiff, glossy, feather-like leaves, it creates a tropical atmosphere.

The species is native to southern Japan and the surrounding islands. Sago palm, which favors tropical and subtropical climates, has become an indispensable feature of prestigious gardens worldwide. It is known for its very slow growth; it may take many years for its trunk to become distinct, but this characteristic makes it a valuable collector's plant.

Cultivation and Uses

Cycas revoluta, commonly known as Sago Palm or Japanese Fan Palm, has a palm-like appearance but actually belongs to the Cycadaceae family and is an extremely ancient plant species that has existed since the age of dinosaurs. With its stiff, glossy, feather-like leaves, it creates a tropical atmosphere.

The species is native to southern Japan and the surrounding islands. Sago palm, which prefers tropical and subtropical climates, has become an essential component of prestigious gardens worldwide. It is known for its very slow growth; it may take many years for the trunk to become prominent, but this trait makes it a valuable collector's plant.
