

RYNCOOSPERMUM JASMINOIDES

www.limakhotels.com

Trachelospermum jasminoides is a species of flowering plant in the family Apocynaceae, native to east and southeast Asia (Japan, Korea, southern China and Vietnam).

Common names include Confederate jasmine, star jasmine, Confederate jasmine, and Chinese star jasmine.

This plant and its variegated cultivar 'Variegatum' have received the Royal Horticultural Society's Award of Garden Merit.

Cultivation and Uses

Trachelospermum jasminoides is commonly grown as an ornamental and houseplant. It is used as a climbing vine in gardens, public spaces and parks, as a ground cover and as a fragrant potted plant on terraces and patios.

It blooms in full sun, partial shade, or full shade and requires well-drained soil (can succumb to fungal infections if kept constantly moist), moderate water, moderate fertilizer, and a climbing structure (optional: trellis or other plant). Propagation is usually from cuttings/clones.
